

Implement multi-tenant data isolation and test data cleanup

Entity-Based Data Isolation:

- Added session-based authentication to all entity/user APIs
- Platform admins can see all entities/users across organizations
- Regular users only see data from their own entity
- Entity admins can only create users within their entity
- Proper permission checks for entity/user creation

Test Data Cleanup:

- Created endpoint to clear all test/fake data while preserving admin user
- Added cleanup functionality to setup page with confirmation
- Prepares database for production QuickBooks integration
- Maintains data integrity during cleanup process

Multi-Tenant Security:

- Session validation on all protected endpoints
- Role-based access control (Platform Admin vs Entity Admin vs User)
- Data filtering based on entity membership
- Permission validation for cross-entity operations

Ready for production QuickBooks integration with proper data isolation.
